PQ0663 membrane protein - porcine epidemic diarrhea virus (isolate Beigian CV777) (fragment)

3 IIHKNL 8

RESULT 3

N

```
elastase - Pseudomonas aeruginosa
Cispecies: Pseudomonas aeruginosa
Cybacession: 820446
R;Kessler, E.; Safrin, M.; Peretz, M.; Burstein, Y.
R;Kessler, E.; Safrin, M.; Peretz, M.; Burstein, Y.
A;Title: Identification of cleavage sites involved in proteclytic processing of Pseudomonas and a momber: 820446; MJID:92183956; PMID:1544509
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A,Molecule type: protein
A,Residues: 1-8 <LOT>
C,Comment: The identity of the glycoprotein from which this peptide is derived is unknowned as also been found (see PIR:XGHUE).
C,Superfamily: unassigned animal peptides
C,Keywords: glycoprotein
F,L/Binding site: carbohydrate (Cys) (covalent) #status experimental
                                                                                                              ribosomal protein MRP-S23, mitochondrial - bovine (fragment)
C;Species: Bos primigenius taurus (cattle)
C;Cjate: 20-Sep-1999 #sequence_revision 20-Sep-1999 #text_change 20-Sep-1999
C;Accession: S76764
B;Graack, H.R.
submitted to the Protein Sequence Database, July 1999
A;Reference number: 978760
A;Accession: S78764
A;Accession: Brotein
A;Accession: Local type: protein
A;Accession: Local type: protein
C;Keywords: mitochondrion
F;1-6/Product: ribosomal protein MRP-S23 (fragment) #status experimental <MAT>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   C)Accession: A03188

trypsin (EC 3.4.21.4) precursor - minke whale (fragment)
(Species: Balaenoptera acutorostrata (minke whale, lesser rorqual)
(Species: 17-Jul-1994 #sequence_revision 17-Jul-1994 #text_charge 07-May-1999
(Accession: A61328
R.Bricteux-Gregoire, S.; Schyns, R.; Florkin, M.; Emmens, M.; Welling, G.W.; Beintema, Blochim. Biophys. Acta 386, 244-255, 1975
A.Title: N-terminal amino acid sequence of trypsinogen from the lesser rorqual, Balacn creas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               T-cell receptor beta chain V-D-J region (clone 13) - rat (fragment)
C;Species: Rattus norvegicus (Norway rat)

Froeil receptor beta chain V-D-J region (120-2K) - mouse (fragment)
T-cell mus musculus (house mouse)
C.Species: Mus musculus (house mouse)
C.Date: 17-Jul-1992 #sequence_revision 17-Jul-1992 #text_change 30-May-1997
C.Accession: PTC601; PTC617; PTC694
J.Exp. Med. 174, 115-124, 1991
J.Exp. Med. 174, 115-124, 1991
A.Accession: PTC609; MUD:91277601; PMID:1711558

Arch. Blocker. Blophys. 178:69-78(1977).

-!- FUNCTION: TRANSALDOLASE IS IMPORTANT FOR THE BALANCE OF METABLOLISE IN THE PATHWAY.

-!- CATALYTIC ACTIVITY: Seacheptulose 7-phosphate + D-glyceraldehyde 3-phosphate = D-erythrose 4-phosphate + D-fructose 6-phosphate.

-!- PATHWAY: Pentose phosphate pathway; nonoxidative part.
-!- PATHWAY: Pentose phosphate pathway; nonoxidative part.
-!- SIMILARITY: BELONGS TC THE TRANSALDOLASE FAMILY. SUBFAMILY 1.

FIR, A12872; A22872.

InterPro; IPR001585; Transaldolase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        "Transcriptional regulation and gene arrangement of Escherichia coli, Cirrobacter freundal and Salmonella typhimurium brotin operons."; Gene 67:203-211(1988).

"Isolation of a peptide containing a histidinyl-cysteinyl sequence from the active center of transaldolates";

Arch. Biochem. Biophys. 167:555-33(1976).

-!- FUNCTION: TRANSALDOLASE IS IMPORTANT FOR THE BALANCE OF MATABOLITES IN THE PRIVOSE-PHOSPHATE PATHWAY.

-!- CATALYTIC ACTIVITY: Sedoheptulose 7-phosphate + D-glyceraldehyde 3-phosphate = D-erythrose 4-phosphate + D-fructose 6-phosphate.

-!- PATHWAY: Pentose phosphate pathway; nonoxidative part.

-!- SIMILARITY: BELONGS TO THE TRANSALDOLASE FAMILY: SUBFAMILY 1.

InterPro; IPR001585; Transaldolase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Duve H., Johnsen A.H., Maestro J.-L., Scott A.G., Winstanley D., Davey M., East P.D., Thorpe A.;

                                                                                                                          The present sequence represents part of the minor histocompatibility antigen HA-1 H-allele. The specification describes methods for typing antigen HA-1 in a sample, which comprise detecting polymorphic nucleotides in the cDNA or genomic nucleic acids of the alleles. The methods can be used for HA-1 typing for bone marrow transplants, severe applastic anaemia, leukaemia and immune deficiency diseases, as well as detection of genetic aberrances. The probes and primers of the invention can be used to screen for the HA-1 alleles. The HA-1 peptides can be used anti-idiotypic B cells and/or T cells and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         present sequence represents a new peptide (P1) constituting a T-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         epicope obtainable from the minor histocompatibility ancigen HA-1. The peptide is immunogenic and can be used as part of a vaccine. Pl is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with home marrow transplantation, in the treatment of severe aplastic anaemia, leukaemia, and immune deficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Minor histocompatibility antigen; HA-1; T-cell epitope; immunclogical; graft versus host disease; bone marrow transplant; leukaemia; vaccine; diagnosis; aplastic anaemia; immune deficiency disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A new minor histocompatibility antigen, FA-1 - useful to treat immune diseases and prevent rejection and host versus graft disease in bone marrow and organ transplantation
Typing minor histocompatibility antigen HA-1 - by amplifying and identifying HA-1 R and HA-1 H alleles of HA-1, used for, e.g. detection of genetic aberrances
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents part of the minor histocompatibility antigen HA-1 R-allele. The specification describes methods for typing antigen HA-1 in a sample which comprise detecting polymorphic nucleotides in the CDNA or genomic nucleic acids of the alleles. The methods can be used for HA-1 typing for bone marrow transplants, severe appastic anaemia, lexiwaemia and immune deficiency diseases, as well as detection of genetic aberrances. The probes and primers of the invention can be used to screen for the HA-1 alleles. The HA-1 peptides can be used anti-idiotypic B cells and/or T cells and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                      The present sequence represents a new peptide (P1) constituting a T-cell epitope obtainable from the minor histocompatibility antigen MA-1. The peptide is immunogenic and can be used as part of a vaccine. Plis used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with bone marrow transplantation, in the treatment of severe aplastic anaemia, leuxaemia, and immune deficiency diseases.
                                                                         Minor histocompatibility antigen; HA-1; T-cell epitope; immunological; graft versus host disease; bone marrow transplant; leukaemia; vaccine; diagnosis; aplastic anaemia; immune deficiency disease.

```
The present sequence represents an immunogenic peptide constituting a 1-cell epitope, obtainable from the minor histocompatibility antigen HA-1. The peptide can be used in vaccines or pharmaceutical formulations as medicines to induce tolerance for transplants so as to prevent rejection and/or Graft-versus-Host Disease, or to treat autoimmune diseases. Neoplastic haematopoietic cells presenting the peptides, in an HLA class I context, can be eliminated after specific recognition of the peptides. The peptides can also be used to raise antibodies, I-cell receptor, B- and I-cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Minor histocompatibility antigen; HA-1; T-cell epitope; immunological; graft versus host disease; bone marrow transplant; leukaemia; vaccine; diagnosis; aplastic anacmia; immune deficiency disease.

```
The present sequence represents a new peptide (P1) constituting a T-cell epitope obtainable from the minor histocompatibility antigen H4-1. The peptide is immunogenic and can be used as part of a vaccine. P1 is used as a medicine, to induce tolerance for transplants, prevent rejection and/or graft versus host disease, or to treat (auto) immune diseases. In particular it can be used with home marrow transplantation, in the treatment of severe aplastic anaemia, leukaemia, and immune deficiency
                                                                                                                                                                                                                                                                                                         Gaps
                       A new minor histocompatibility antigen, HA-1 - useful to treat immune diseases and prevent rejection and host versus graft disease in bone marrow and organ transplantation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Typing minor histocompatibility antigen HA-1 - by amplifying and identifying HA-1 R and HA-1 H alleles of HA-1, used for, e.g. detection of genetic aberrances
                                                                                                                                                                                                                                                                                                         0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Intron, minor histocompatibility antigen HA-1; typing allele, H allele; R allele; polymorphic nucleotide; HA-1 typing; bone marrow transplant; severe aplastic anaemia; leukaemia;

The method comprises: (a) delivering an antigen to the mammal at a level to induce an immunological CTL response in the mammal; and (b) maintaining the level of the antigen in the mammal's lymphatic system to maintaining the immunologic CTL response. The method can be used for the delivery of e.g. a differentiation antigen, a tumour-specific multilineage antigen, an embryonic antigen, an antigen, an antigen, an antigen, an extant tumour-suppressor gene antigen, or a viral antigen. They can be used for the treatment of
                                           The present sequence represents an epitope of the minor histocompatibility antigen RA-1. The specification describes merchods for typing alleles (preferably the H and R alleles) of the minor histocompatibility antigen RA-1 in a sample, which comprise detecting polymorphic nucleotides in the cDNA or genomic nucleic acids of the alleles. The methods can the cDNA or genomic nucleic acids transplants, severe apisstic ansemia, leukaemia and immune deficiency diseases, as well as detection of genetic aberrances. The probes and primers of the invention can be used to screen for the RA-1 alleles. The RA-1 peptides can be used anti-idiotypic B cells and/or T cells and antibodies.
                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Inducing a cytotoxic T lymphocyte response - by maintaining a level of antigen in the lymphatic system of a mammal so as to provide a sustained CfL response, used to treat, e.g. AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cytotoxic T-lymphocyte response; CTL; antigen; lymphatic system; immunisation; tumour; infectious disease; immunotherapy; cancer; malignant melanoma; viral disease; hepatitis; AIDS.

The invention relates to a method of inducing and/or sustaining an immunological cyctoxic T lymphocyte (CTL) response in a mammal comprising administering directly to the lymphatic system of the mammal:

(a) an antigen in the form of a polypeptide; (b) a vector comprising an uncleic acid encoding the antigen; or (c) a non-peptide antigen. The method is useful for inducing and/or sustaining CTL response in a mammal. This is particularly useful for treating a mammal having a malignant tumour (e.g. carcinoma, melanoma, leukaemia or lymphoma) or infectious disease (e.g. hepetitis, acquired immune deficiency syndrome (AIDS), malaxia, measles or tuberculosis), or in an animal having a predisposition to these diseases. The mammal may be dogs, cats, mice, cattle, sheep, pigg, goats, rabbits, or preferably humans.

ABG79753-ABG80319 represent viral epitopes on major histocompatibility complex (MHC) class I molecules, used in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          system;
               e.g. viral disease such as heparitis or AIDS. Sustained antigen delivery to the lymphatic system provides for potent CTL stimulation that takes place in the milleu of the lymphoid organ, and it sustains stimulation that is necessary to keep CTL active, cytotoxic and recirculating through the body. AAV10071 to AAV10639 represent examples of peptide antigens given in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Major histocompatibility complex, MHC; MHC class I molecule; virus; epitope; cytotoxic T lymphocyte response; CTL response; lymphatic system antigen; immunogenic; malignant tumour; carcinoma; melanoma; leuxaemia; lymphoma; infectious disease; hepatitis; malaria; measles; tuberculosis; acquired immune deficiency syndrome; AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 originating from a particular cell type, which are capable of binding to major histocompatibility complex (MHC) molecules of a particular haplotype. The method comrises analysing peptides bound to the soluble and secreted form of the MHC molecules of the particular haplotype. The method is useful for identifying peptides for treating an autoimmune disease, such as T or B cell and/or allergic disease or condition, rheumatoid arthritis, or multiple sclerosis, neurodegenerative disorders,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     e.g. Alzheimer's disease, or diseases associated with inflammation. The sequences of the invention may be used in a gene therapy application. This sequence represents a peptide relating to the method for identifying MHC binding peptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying peptides that are capable of binding to major histocompatibility complex (MHC) molecules of a particular haplotype by analyzing peptides bound to the soluble and secreted form of the MHC molecules of the particular haplotype.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel method for identifying peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 9;

The specification describes an assay for screening and identifying pharmaccutically effective compounds that specifically interact with an and modulate the activity of a cellular receptor or ion channel. The assay uses a mixture of recombinant cells, each comprising a receptor of protein whose signal transduction activity is modulated by an interaction with an extracellular signal, a recombinant gene encoding a potential receptor polypeptide, and a reporter gene construct. The assay is useful for rapid screening of large numbers of polypeptides to identify polypeptides are agonizing or agonizing receptor activity, and confinity polypeptides are agonizing or agonizing receptor activity, and complaint of identify ligands for orpian receptors, especially ligands or orpian receptors, especially ligands or orpian receptors, which are useful in drug discovery. The present sequence represents the aminon terminal of the Galpha subunit determinants involved in G-alpha-G-betagamma association.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identification of compounds modulating cellular receptor activity useful for identifying and screening for ligands for orphan receptors, comprises using recombinant cells comprising both receptors and test
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      G protein coupled receptor; GPCR; cellular receptor; ion channel; surrogate ligand; orphan receptor; G-alpha subunit; GPA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method for providing, identifying or/and optimising peptides which induce cytotoxic T-lymphocytes and to the uses of the obtained peptides for vaccination. The method is useful for providing, identifying and/or optimising peptides that are useful in manufacturing a pharmaceutical composition for the induction of cytotoxic T-lymphocytes, and for the prevention, treatment or diagnosis of cancer or viral infections. The invention is also used in gene therapy. The present sequence is human mageB peptide used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Providing, identifying or optimizing peptides for inducing cytotoxic T-lymphocytes and for treating cancer, comprises selecting conserved regions in antigenic proteins and identifying CD8+ T-cell epitopes in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                            Human; T-lymphocyte; vaccine; viral infection; gene therapy; cancer.

The invention relates to a recombinant yeast cell having an endogenous yeast pheromone system pathway and comprising a heterologous G protein coupled receptor which functionally couples to the pathway and a mutation which renders an endogenous yeast Stp22 protein non-functional. The recombinant yeast cell exhibits enhanced sensitivity to ligandinicoed Cyprotein stimulation and is used for identifying compounds that modulate a G protein coupled receptor. It is useful in drug screening assays. The present sequence is yeast GPA1 amino terminal peptide used
                                                                  Recombinant yeast cell having enhanced sensitivity to ligand-induced G-protein stimulation for use in drug screening assays, comprises a heterologous G protein coupled receptor and a mutated stp22 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Hypertension; myocardial infarction; congestive heart failure; endstocks shock; subarachhoid hemorrhage; asthma; arrhythmias; acute renal failure; precelampsia; diabetes; metabolic; endocrinological; electological; disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New peptide(s) used as endothelin antagonists - for treating hypertension, metabolic and endocrine disorders, heart failure, diabetes, asthma, neurological disorders, etc.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The specification describes a method for identifying a ligand for an orphan G protein coupled receptor (GPCR). The method comprises rapidly screening large numbers of polypeptides in a yeast expression library to identify those polypeptides which induce or antagonise receptor bioactivity. The method is useful for screening and identifying pharmaceutically effective compounds that specifically interact with assay is particularly amenable for identifying surrogate ligands for orphan receptors. The present sequence represents a peptide derived from a yeast G-alpha subunit (GPA).
                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying a ligand for an orphan G protein coupled receptor comprises using an recombinant yeast expression library -

No, is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
